

v.15.20.19  
07/07/21

MH's request

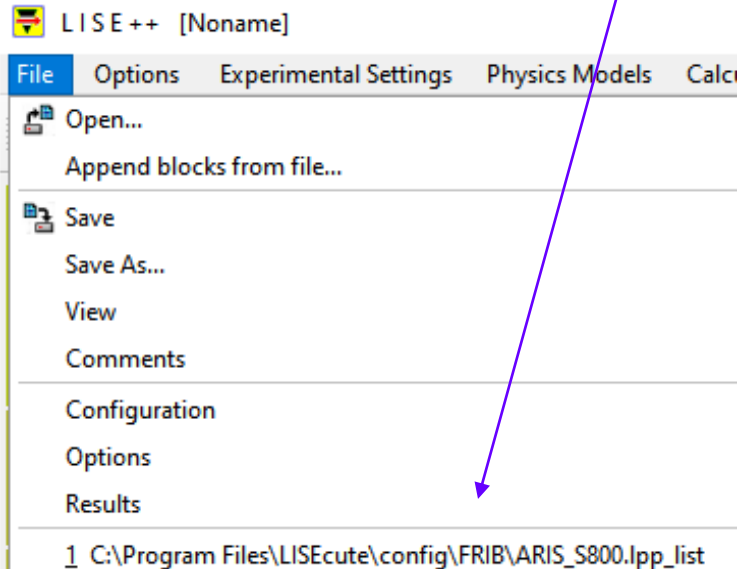

## From **File/Open** or **File/Config/Open**

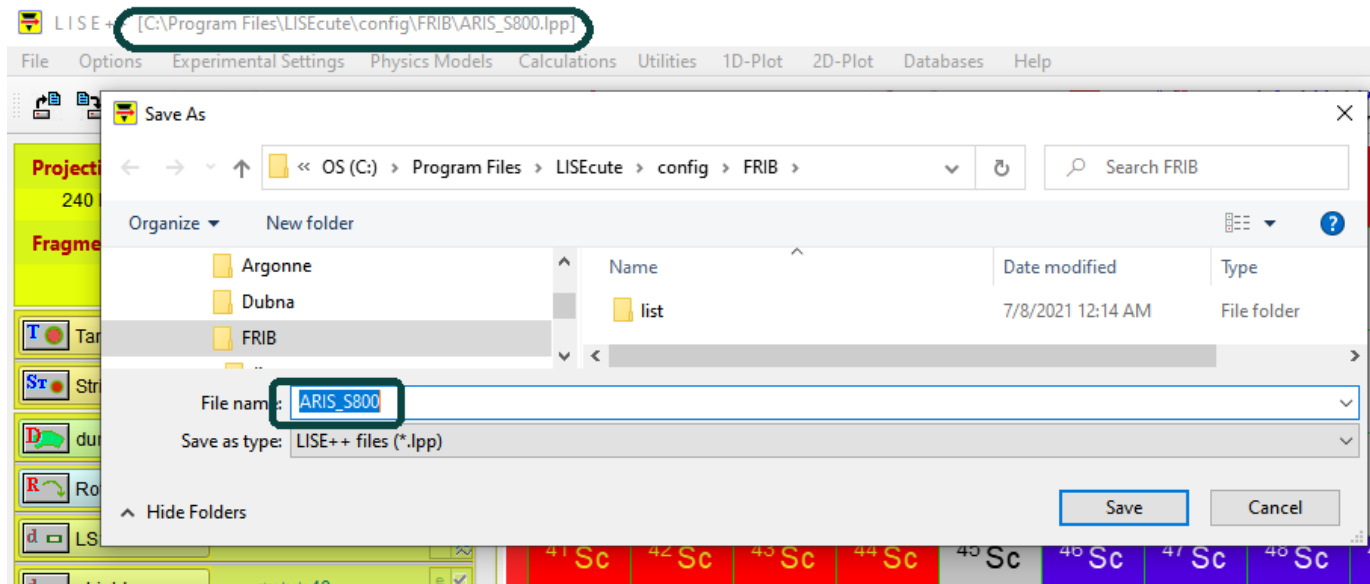

- If the first file in the list is LPP-file (not lcn-file), then LISE downloads reaction options from this file.
- Only block information is taken from other files, and from first file is lcn-format file.
- Both “lpp” and “lcn” types can be used in the files list.
- “Reaction.lpp” file in this example has only two obligatory blocks (target & stripper)

## 1. LISE files list in recent files list

2. LISE files list is associated to LISEcute code. After clicking on LISE files list file in explorer, LISE runs and downloads this file.

3. After completion of reading a files list, the code names current LISE settings as the *files list name* with “lpp” extension, and asks to save.

4. After completion of reading a files list, the code names current LISE configuration as the *files list name* with “lcn” extension
